## Problem 1

To show that  $L$  is a context-free language, construct a PDA that accepts  $L$ .

$A$  and  $B$  are regular languages  $\implies$  There exist DFAs  $M_A$  and  $M_B$  that accepts  $A$  and  $B$  respectively.

Construct the following PDA:

---

**Algorithm 1:** PDA for  $L$ 

---

```
Initialize  $M_A$ 
while  $M_A$  is not in an accept state do
  | Simulate  $M_A$ 
  | Push an X onto the stack
Initialize  $M_B$ 
while  $M_B$  is not in an accept state do
  | Simulate  $M_B$ 
  | if Stack is empty then
    | Reject
  | Pop an X from the stack
if Stack is empty then
  | Accept
Reject
```

---

This PDA correctly decides  $L$ .

*Proof.* Case 1:  $M_A$  pushes more X's than  $M_B$  pops  $\implies$  PDA rejects.

Case 2:  $M_A$  pushes fewer X's than  $M_B$  pops  $\implies$  PDA rejects.

Case 3:  $M_A$  pushes exactly the same number of X's as  $M_B$  pops  $\implies$  PDA accepts.

Therefore PDA correctly decides  $L$ . □

## Problem 2

Prove languages are not context free using the pumping lemma for context free languages

**a**

*Proof.* Proof by contradiction: assume  $L$  is a context free language;

$\implies \exists p \geq 1$  such that every string  $s \in L$  with length larger than  $p$  can be written as:

$$s = uvwxy$$

where  $u, v, w, x, y$  are substrings of  $s$  such that:

1.  $|vx| \geq 1$
2.  $|vwx| \leq p$
3.  $\forall k \geq 0, uv^kwx^ky \in L$

For  $vw x$  there are following possible cases:

1.  $vw x = a^i$ ,  $i \leq p$ , then  $uv^kwx^ky$  has at least  $k$  more  $a$ 's than  $s \implies uv^kwx^ky \notin L$  if  $k \geq 1$
2.  $vw x = a^ib^j$ ,  $i + j \leq p$ , then  $uv^kwx^ky$  has at least  $k$  more  $a$ 's and  $b$ 's than  $s$  but no more  $c$ 's  $\implies uv^kwx^ky \notin L$  if  $k \geq 1$
3.  $vw x = b^i$ ,  $i \leq p$ , then  $uv^kwx^ky$  has at least  $k$  more  $b$ 's than  $s \implies uv^kwx^ky \notin L$  if  $k \geq 1$
4.  $vw x = b^ic^j$ ,  $i + j \leq p$ , then  $uv^kwx^ky$  has at least  $k$  more  $b$ 's and  $c$ 's than  $s$  but no more  $a$ 's  $\implies uv^kwx^ky \notin L$  if  $k \geq 1$
5.  $vw x = c^i$ ,  $i \leq p$ , then  $uv^kwx^ky$  has at least  $k$  more  $c$ 's than  $s \implies uv^kwx^ky \notin L$  if  $k \geq 1$

This contradicts the pumping lemma, therefore  $L$  is not a context free language.  $\square$

**b**

*Proof.* Proof by contradiction: assume  $L$  is a context free language;  
 $\implies \exists p \geq 1$  such that every string  $s \in L$  with length larger than  $p$  can be written as:

$$s = uvwxy$$

where  $u, v, w, x, y$  are substrings of  $s$  such that:

1.  $|vx| \geq 1$
2.  $|vw x| \leq p$
3.  $\forall k \geq 0, uv^kwx^ky \in L$

For  $vw x$  there are following possible cases:

1.  $vw x = 0 \implies v^kwx^ky \notin L$  if  $k \geq 1$  because it would have extra 0s
2.  $vw x = 1 \implies v^kwx^ky \notin L$  if  $k \geq 1$  because it would have extra 1s
3.  $vw x = 0^i10^j$ ,  $i + j + 1 \leq p \implies v^kwx^ky \notin L$  if  $k \geq 1$  because of the extra 0s
4.  $vw x = 0^i$ ,  $i \leq p \implies v^kwx^ky \notin L$  if  $k \geq 1$  because of the extra 0s

This contradicts the pumping lemma, therefore  $L$  is not a context free language.  $\square$

### Problem 3

I do not know the answer to this question.
